

Nightly Home Cleaning Schedule

A self-hosted, static web app that assigns a 20-minute cleaning task to each of you, every night, on a rolling 4-week cycle — automatically calculated from today's date. No backend, no database, works forever.

Files

- `index.html` — the app shell
- `styles.css` — iOS-style visual design
- `app.js` — date logic, rendering, and localStorage tracking
- `tasks.json` — your full house task data (edit this anytime to change rooms/tasks)

How it works

- **Anchor date:** 2026-09-24 is day 0 of the rotation. Every day since then advances the rotation by one, and it wraps every 28 days (`dayNumber % 28`), so it runs indefinitely without ever needing new data.
- **Each night:** both of you see one shared "room focus" and two different 20-minute tasks (Task A / Task B) tackling that room together.
- **Daily reminders:** dishes and living room tidy-up show every single day, separate from the rotation, so they never get "used up" as one of your 28 unique tasks.
- **Monthly seasonal task:** one bigger seasonal project (deep clean oven, wash windows, flip mattresses, etc.) appears as a persistent card for the whole calendar month, cycling through 12 seasonal tasks by month, forever.
- **Views:** Today / Week / Month tabs at the top, iOS-style cards and spacing, safe-area padding for notch/home-indicator, and works great added to your iPhone home screen (Share → Add to Home Screen) for an app-like feel.
- **Names:** Tap the "Names" gear/link to set your two names once — it's saved in the browser's localStorage on each device.
- **Progress:** Checking off a task saves to localStorage per-date, so completed tasks show a checkmark if you revisit that day.

Deploying

Push all four files to the root (or a `/docs` folder configured for Pages) of your GitHub repo and enable GitHub Pages. No build step required.

Customizing

Edit `tasks.json` directly:

- `nightlyRotation` — the 28-night array, each with `room`, `taskA`, `taskB`.
- `dailyTasks` — the always-daily reminders.
- `seasonalTasks` — the 12 monthly deep-clean projects.
- `meta.cycleLengthDays` — must match the length of `nightlyRotation` if you change the number of nights.
- `meta.anchorDate` — the date that maps to night 0 (keep as-is unless you want to reset the rotation start).
